

WhereWear — User Testing Protocol

V1 Prototype · Sophie Laurent persona

Welcome script (read at the start of each session)

Hello, and thank you for taking the time to participate in this test. We will be together for about one hour. Let me take a few minutes to explain the context.

I am a UX designer at Gobelins, working on a project for WhereWear, a peer-to-peer luxury fashion rental app. You are going to test the prototype. The goal is not for me to guide you, and this is not an exam — there are no right or wrong answers.

This is a prototype, so not everything is active. Do not worry if some links are not clickable. I am not assessing the completeness of the app, but the clarity of the navigation on the journeys I will propose to you.

I will propose one scenario. Throughout the session I will ask you to think aloud, which means verbalising:

- what you read
- what you understand
- what you do
- your questions
- your observations and feelings

My goal is to understand how you move through the journeys, not to validate that you found the “right” path. I will not give you the solution. I need you to comment your actions so I can understand the navigation logic that makes sense to you.

I will record this session so I can review specific moments afterwards and better understand how to improve the prototype.

Could you please silence your phone so we can focus fully on the test? Thank you.

Is everything clear?

1. Test objectives

- Validate design choices: assess whether a new user (Sophie persona, the Occasion Seeker) understands and completes the tasks without assistance.
- Evaluate efficiency of the tool: number of clicks, errors, navigation fluidity.
- Detect usability issues (effectiveness, efficiency, satisfaction).
- Identify misunderstandings: terminology, labels, functions.
- Validate the V1-specific hypotheses: occasion-first entry, AI chatbot event creation, fit-proof sufficiency, trust signals before booking.

2. Participant profile and recruitment

- Number: 8 to 10 participants.
- Primary persona — Sophie Laurent (the Occasion Seeker):

- Women, 28–42 years old.
- Lives in a major city (Paris primarily; Lyon, Bordeaux as secondary).
- Attends 3+ events per year requiring a specific outfit (weddings, professional galas, formal dinners, trips).
- Treats fashion as a service rather than a community.
- Mix: 5–6 participants with prior fashion rental experience, 2–4 without.
- Secondary profiles (1–2 participants each, as guardrails):
 - Hannah-aligned (the Controlled Minimalist): organised, plans ahead, fewer events per year.
 - Nelly-aligned (the Expressive Explorer): adventurous, treats fashion as expression.
- Recruitment: personal network and snowball sampling; screened against the profile via a short questionnaire.

3. Material and environment

- Tools:
 - Interactive prototype (Figma).
 - Microsoft Teams (screen share, audio and video recording).
- Preparation:
 - Send the Teams link in advance.
 - Send the prototype link at the start of the test.
 - Technical check (sound, video, screen share) at session start.

4. Session structure (60 minutes)

Stage	Duration	Content
Welcome & introduction	5 min	Test presentation, objectives, recording consent.
Briefing	5 min	Think-aloud rules, no right or wrong answers.
User scenarios	40 min	1 task (see section 6).
Debrief & post-test	10 min	Satisfaction questionnaire, open questions.

5. Common instructions

1. Think aloud (explain your actions, what you read, your questions, your emotions).
2. This is not an exam: any feedback (positive or negative) is valuable. This is not my project — you do not need to spare my feelings.
3. If something is not interactive, verbalise what you expected to happen.
4. If you get stuck, simply say so. The moderator will only intervene to prompt the think-aloud.
5. Prototype link: [insert Figma prototype URL]

6. Scenario and task

Prototype Test — Rent a dress for a friend's wedding

- Scenario: a friend is getting married in 3 weeks. You want to rent a dress for the ceremony.

Please complete the full journey as naturally as possible:

1. Start by finding a dress that could work for the wedding.
2. Use any filters or options that help you refine the choice.
3. Open the dress you prefer and check whether you feel confident about the fit, condition, owner, delivery and price.
4. Continue until the booking is ready to be confirmed.
5. Pay attention to the rental rules, delivery, deposit, cleaning and total price.

There are no right or wrong answers. Please think aloud while testing: say what you read, what you understand, what feels clear, unclear, missing or confusing.

7. Measures and hypotheses

Quantitative

- Success rate per task (binary: completed or abandoned).
- Time on task.
- Number of errors and retries.
- Number of moderator prompts.

Qualitative

- Verbatim quotes.
- Emotional reactions (confidence, hesitation, doubt, delight).
- Spontaneous suggestions.

Hypotheses to validate

- H1 — Occasion-first entry is more intuitive than catalogue or search-first entry for users with a specific event in mind.
- H2 — A 3-question AI chatbot is sufficient to generate a usable event profile, without feeling intrusive or excessive.
- H3 — The “Fit proof” information (photos, fit notes, condition) provides enough confidence to commit to a rental.
- H4 — Owner confidence indicators (profile, reviews, wardrobe style) materially reduce hesitation at the commitment moment.
- H5 — Rental rules made visible before booking reduce post-booking anxiety rather than causing abandonment.
- H6 — Sophie completes the full journey (occasion entry → booking confirmation) in under 8 minutes on the prototype.

8. Post-test questionnaire

System Usability Scale (Likert 1–5: strongly disagree → strongly agree)

6. I think that I would like to use this service frequently.
7. I found the service unnecessarily complex.

8. I thought the service was easy to use.
9. I think that I would need the support of a technical person to be able to use this service.
10. I found the various functions in this service were well integrated.
11. I thought there was too much inconsistency in this service.
12. I would imagine that most people would learn to use this service very quickly.
13. I found the service very cumbersome to use.
14. I felt very confident using the service.
15. I needed to learn a lot of things before I could get going with this service.

WhereWear-specific items (Likert 1–5)

16. I felt confident that I could find a piece appropriate for my occasion.
17. I had enough information to decide whether the piece would fit me.
18. I trusted the owner enough to commit to the rental.
19. The rental terms (deposit, cleaning, return) felt fair and clear.

Open questions

- What would have made the experience easier?
- Which moment in the journey gave you the most hesitation?
- Which moment gave you the most confidence?
- Anything missing?

9. Analysis and deliverables

- Synthesis: identification of friction points and recurring patterns across participants.
- Recommendations: priority actions ranked by UX impact, mapped back to user stories S01–S16.
- Hypothesis verdict: validated, invalidated, or inconclusive per hypothesis H1–H6.
- Deliverables:
 - Detailed report with verbatim quotes, video excerpts, and recommendations.
 - Updated user flow with friction annotations.
 - Prioritised backlog for prototype V2.
