

The UX audit of the existing mobile app. shows that the mobile app already has a usable base, but key journey steps still need to be clearer and simpler.

UX Audit Outcomes

H.O.R.S.E Recommendations

Hide

- Remove filters that lead to empty results.
- Show the number of available items next to each brand, or grey out unavailable brands.

Organize

- Regroup categories and make navigation toward subcategories clearer.
- User expectations: to respond to users' need for novelty, adding a "new arrivals" filter (sorted by upload date) appears essential.

Reduce

- Limit the number of categories at the first hierarchical level based on events/usages.

Standardize

- Harmonize the behavior of filtering interactions.

Eliminate

- Remove unnecessary filters, such as "one size only." Remove unnecessary filters, such as "one size only"

The main recommendations are to hide non-essential elements, organize content better, reduce effort, standardize and eliminate unnecessary steps.

Criterion	Description	Score	Comments
Guidance	Means that help users orient themselves when using the interface	6	- Help discontinuity: the onboarding tutorial stops abruptly at the beginning of the rental flow, leaving the user without guidance. - Product information gap: key data points, such as fabric composition, are often missing. Recommendation: prompt the user to photograph the fabric label when adding an item. - Affordance issue: some purely informational elements look like clickable buttons, creating confusion about possible interactions. - Visibility of system status: although distance sorting is available, the exact distance is not shown in the results list; the user has to open each item to find the information.
Workload	Reduction of users' perception and memory effort	5	- Local search optimization: geolocation is enabled, but users cannot finely filter or sort items by actual proximity. - Empty-result management: the brand filter too often leads to empty pages. - Information architecture: the current categorization is too dense and not intuitive enough; the hierarchy between categories and subcategories lacks visual clarity. - Filtering complexity: the interface for selecting and deselecting filters, along with the "Select all" button, makes the search journey heavier. - Price filters: as on Airbnb, it would be useful to display a price histogram to avoid no-result price ranges. - State feedback: some inactive filters still appear "active," which can mislead users.
Explicit Control	Only triggers actions explicitly requested by the user	8	- Freedom of choice: the "clean handover" option is checked by default, which may force a non-desired choice. - Temporal flexibility: the rental period is preselected by the system; the user is constrained by imposed durations and cannot freely define a custom number of rental days.
Adaptability	Flexibility allowing the user to achieve the same goal in different ways	7	- User profiles: the application does not allow users to clearly switch between "Seller" and "Buyer" roles. - Multimodality: proximity search is limited to a list view; the absence of a map view restricts spatial navigation. - Internationalization: the interface is available only in French, limiting accessibility. - Payment flexibility: payment options are restricted to card and Apple Pay only.
Error Management	Protection against errors	10	No major issue identified.
Consistency / Homogeneity	Coherent and predictable interface behavior	10	No major issue identified.
Meaning of Codes	Use of clear, relevant, domain-consistent language and signs	10	No major issue identified.
Compatibility	Interface adapted to the user profile and context	7	Contextual relevance: too many filters are proposed that are not relevant to the current search context.

The ECD audit shows that the website is too heavy, mainly due to media weight. Reducing non-essential resources could improve its EcoIndex score.

H High M Medium L low

Critical	Off target	Off target
Page weight 19.822 MB Target: 1.024 MB Median: 2.41 MB × 19 above target	DOM complexity 839 elements Target: 600 elements Median: 693	Server requests 70 requests Target: 40 requests Median: 78

UX & JOURNEY

CONTENT

INTERFACE & AD

App pop-up on load A QR code modal appears immediately on landing – immediate friction with no added value. Remove it or trigger it after 30 seconds / after user action. H	Uncompressed media 19.8 MB per page – mainly due to unoptimized images and assets. Convert to WebP, apply aggressive compression, and systematic lazy loading. H	External fonts loaded Non-system typefaces create additional external requests on each load. Replace with system fonts or limit to one loaded variant. M
Unprioritized navigation Menu sections are weakly differentiated, with no clear hierarchy between offers and editorial content. Reduce to a maximum of 3 entries focused on user benefit. H	No content hierarchy No strong headings and no key data highlighted above the fold. Restructure with clear H1/H2 headings, highlighted figures, and visible CTAs. H	Light background dominates Off-white background across the site – suboptimal in energy terms on OLED screens. Explore a dark mode version or darker backgrounds in key sections. M
No low-tech alternative No fallback is provided if the service is unavailable or slow. Add a static degraded mode or a direct contact link. M	Unused static resources Potentially orphan pages and content have not been audited. Review scroll depth and remove pages with under 20% reading depth. M	Unjustified animations Animated elements whose UX value is not documented. Audit each animation and keep only those that reduce cognitive load. L
