

Card sorting translated content inventory into user-facing categories and navigation logic.

The exercise started from the current WhereWear content repository: screens, labels, filters, product attributes, CTAs, trust signals and service rules were turned into cards.

The cards were then sorted in two ways: first by content family, then by user journey stage, to understand both what the app contains and where each item should support the rental experience.

The output allows to analyze what should be grouped, renamed, surfaced earlier or moved closer to the booking moment.

Card sorting by information category

The first board transformed the app inventory into content cards and grouped them by information family:

- Discovery
- Search
- Product info
- Item listing
- Filters
- Booking
- Logistics
- Profile
- Wardrobe
- Messaging
- Notifications
- Settings.

Card sorting by user journey stage

The same cards were then placed across the rental journey:

- Trigger, discovery, evaluation, transaction, logistics, use, return and post-rental.

Translate into Information Architecture decisions

The synthesis helped identify which content should be grouped, renamed, simplified or surfaced earlier to support the future app structure.

[Deep-dive into Card Sorting Exercise](#)

The first Mural board organized the existing app content by category, showing the main information families already present in the product.

The second Mural board mapped the same cards across the user journey, showing where each piece of information should appear in the rental experience.

Card sorting showed that existing app. already has the content. New IA should enhance occasion-led search, fit, availability and booking confidence.

1. Discovery & Structure

2. Evaluation & Confidence

3. Booking & Trust

1

Content is rich, but fragmented
Useful content already exists, but discovery, filters, item details and account elements do not yet work as one clear system.

High

2

Occasion layer
Collections should connect more clearly to real moments such as weddings, ski trips, parties, pregnancy and work events.

A B

Medium

3

Contextual help
Help content should appear inside relevant journey moments instead of being separated from the decision flow.

C D E G

Medium

4

Critical data sits in the decision zone
The most important signals cluster around evaluation: size, date, price, condition, owner, delivery, deposit and return.

C

High

5

Availability earlier
Date availability should be visible before the user becomes emotionally invested in a piece.

B C

High

6

Fit confidence
Brand sizing, fit notes, measurements and renter feedback should reduce uncertainty before booking.

C

High

7

Owner credibility
Owner profile, reviews, wardrobe quality and response cues should be easier to judge.

C D

High

8

Reassurance appears too late
Cleaning, protection, delivery and return information currently arrive too late to fully support confidence.

D E G

High

9

Rental conditions
Deposit, guarantees, delivery, return and service responsibilities should be brought into the booking decision more clearly.
