

The benchmark shows that leading transaction platforms do not organize navigation around content lists, but guide users through a decision path. (1/2)

ID	IA point to address in target arborescence	 airbnb	 BlaBlaCar	AVIS [®]	Pinterest	What it means for target IA
1	Start navigation from user intent, not product categories					Create a first-level entry around occasion / moment: wedding, ski trip, party, work event, seasonal need.
2	Make the main search path guided, not just open-ended					Search should guide Sophie from occasion → date → size → location / delivery → available pieces.
3	Bring practical constraints into the first search layer					Date, availability, size, price and delivery mode should appear before or during search results, not only on item detail.
4	Keep inspiration separate from transactional search					Add a Discover / Inspiration layer for lookbooks, curated collections and saved ideas, before precise filtering.
5	Make results pages a decision space, not only a list					Results should expose item card essentials: photo, size, price, availability, location / delivery, owner cue.
6	Use item detail as the main decision page					Item detail should regroup fit, condition, availability, owner profile, reviews, rental rules and booking CTA.
7	Make owner / provider credibility visible before booking					Owner profile, reviews, response cues and wardrobe quality should sit close to item detail and booking.
8	Separate booking conditions into clear blocks					Deposit, cleaning, delivery / pickup, return and cancellation should be explicit sections before confirmation.

 Yes  No  Partly

The benchmark shows that leading transaction platforms do not organize navigation around content lists, but guide users through a decision path. (2/2)

ID	IA point to address in target arborescence	 airbnb	 BlaBlaCar	AVIS [®]	Pinterest	What it means for WhereWear target IA
9	Create a clear confirmation / recap step					Add a booking recap page with dates, total price, deposit, delivery, return and rental conditions.
10	Separate post-booking management from discovery					Create a Bookings / Rentals area for upcoming, active and past rentals, separate from browsing.
11	Link messages to the transaction object					Messages should be connected to the item and booking, not only a generic chat list.
12	Use saved intent as part of the IA					Create saved pieces, saved looks and followed wardrobes as a structured branch, not only a heart icon.
13	Support repeat usage through personal preferences					Profile should contain size profile, favorite brands, preferred occasions, delivery preferences and saved wardrobes.
14	Keep account/profile separate from active rental journey					Profile should hold preferences, payments, settings and wardrobe; Bookings should hold rental activity.
15	Place help content contextually inside the journey					Deposit, cleaning, return and damage help should appear inside item detail / booking, not only in FAQ.
16	Avoid overloading the bottom navigation with mixed roles					For Sophie V1, bottom nav should prioritize renter journey: Discover, Search, Bookings, Messages, Profile. "Add item" can sit inside Profile / Wardrobe.
